

## Automated Computer Forensics Training in a Virtualized Environment

*By*

**Stephen Brueckner, Frank Adelstein, David Guaspari, Joseph Weeks**

*Presented At*

The Digital Forensic Research Conference

**DFRWS 2008 USA** Baltimore, MD (Aug 11<sup>th</sup> - 13<sup>th</sup>)

DFRWS is dedicated to the sharing of knowledge and ideas about digital forensics research. Ever since it organized the first open workshop devoted to digital forensics in 2001, DFRWS continues to bring academics and practitioners together in an informal environment. As a non-profit, volunteer organization, DFRWS sponsors technical working groups, annual conferences and challenges to help drive the direction of research and development.

# Motivation

- Traditional disk forensics training well-established
  - ◆ Universities, training firms, and online courses
  - ◆ Laboratory exercises typically disk image analysis
  - ◆ Often tool-specific or certification-oriented
- Live (“rapid”) forensics training is newer
  - ◆ Harder to set up live exercises
  - ◆ SANS, CERT have some capabilities
- Constructivist learning theory
  - ◆ “Hands-on” learning by doing
  - ◆ Realistic environment
  - ◆ Personalized training experience

# *Approach*

---

## ■ **Requirements**

- ◆ Live, “free play” exercises (not “cookbook” exercises)
- ◆ Realism: systems, attacks, tools
- ◆ Automated monitoring & evaluation (reduce instructor workload)
- ◆ High availability (access anytime, anywhere)

## ■ **Complications**

- ◆ Simulators lack full fidelity and realism
- ◆ Real systems
  - Support arbitrarily rich scenarios
  - But lack the control and observability of simulators
  - Make automation a challenge

## ■ **Our approach: Virtual Machines (VMs)**

- ◆ VMs are essentially real systems
- ◆ Provide full fidelity
- ◆ Simplify control
- ◆ Improve observability

# *Cyber Defense Trainer (CYDEST)*

---

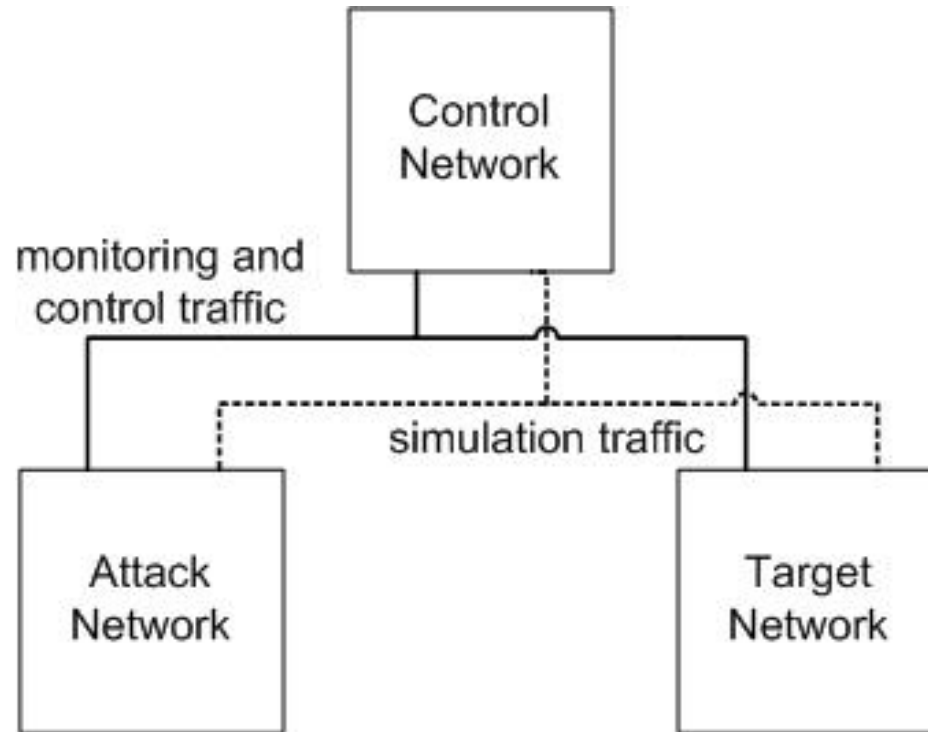

- Training platform for tactical-level exercises
  - ◆ Network security
  - ◆ Static or live forensics
  
- Target audience “in the trenches”
  - ◆ First responders
  - ◆ Network administrators
  - ◆ Forensic investigators
  
- Features
  - ◆ Web accessible
  - ◆ Full fidelity & realism (not a simulator)
  - ◆ Automation
    - Dynamic attacks
    - Performance assessment

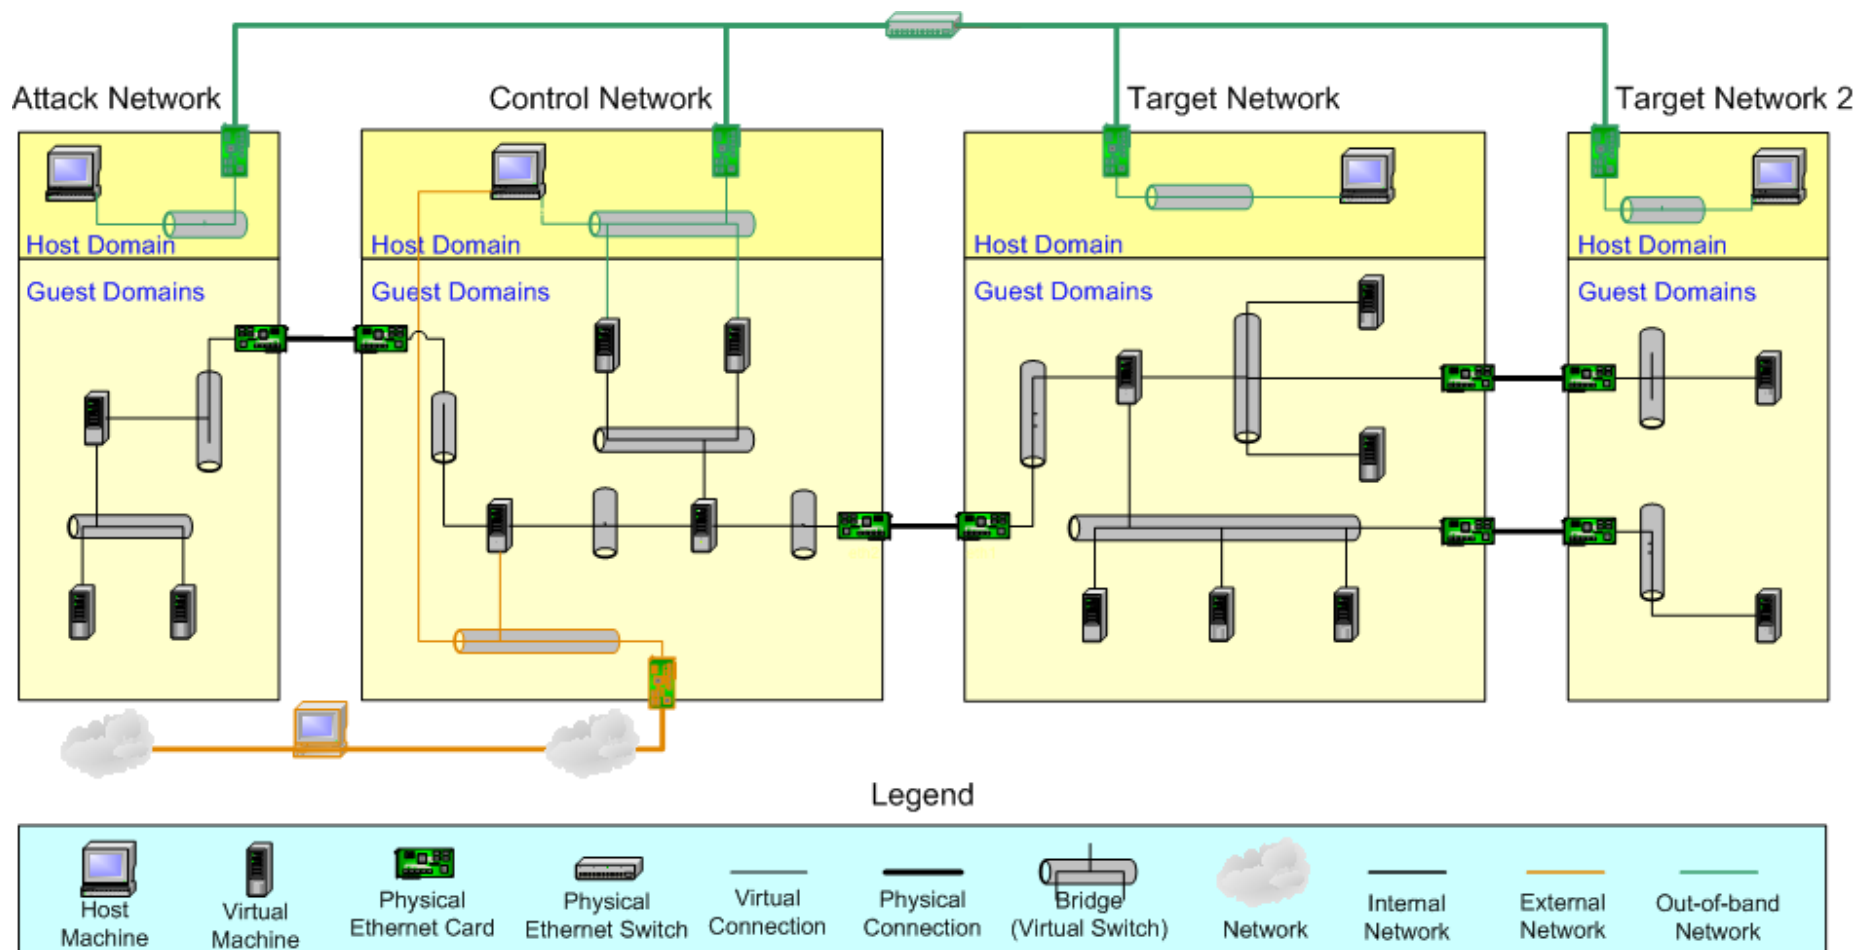

# *CYDEST architecture*

---

# CYDEST instance

# *Challenge: maintaining state model*

---

## ■ **Simulators are simplified models plus interfaces**

- ◆ System state is well-defined and accessible
- ◆ Allows complete control over state

## ■ **VMs are full fidelity and lack an API**

- ◆ State space is voluminous
  - Full complexity of hardware and OS
- ◆ States can be manipulated only indirectly
  - Can't just flip a state variable
- ◆ States can only be known by probing
  - Can't just read a state variable
- ◆ Knowledge of state becomes stale
  - Must login and run processes

# *Solution: maintaining state model*

---

- **State space is voluminous**
  - ◆ Only track state relevant to the current training scenario
  
- **States can be manipulated only indirectly**
  - ◆ Interface to mediate access to VMs
  - ◆ Uses out-of-band network to reduce footprint
  
- **States cannot be known without probing**
  - ◆ Automated polling system to query VMs
  
- **State model becomes stale**
  - ◆ Acceptable due to the “human pace” of training scenarios

# *Active evaluation methods*

---

- Active evaluation
  - ◆ Monitor the instructions the student issues
  - ◆ Monitor system state parameters the student affects
  - ◆ Monitor system behavior resulting from student actions
  
- Teaching forensics as a process
  - ◆ Active evaluation monitors what the student is doing
    - But not why he is doing it
  - ◆ Most of the forensic process executes in the practitioner's head
  - ◆ We need something beyond active evaluation

# *Passive evaluation methods*

---

- Electronic Lab Notebook
  - ◆ “show your work”
  - ◆ First responders & forensic analysts take notes
  - ◆ General format
  - ◆ No leading questions
  - ◆ Harder to parse & evaluate
  
- Direct queries
  - ◆ IM or final quiz
  - ◆ leading questions OK if we control their timing
  - ◆ Consider them like “hints”
  - ◆ Easier to parse & evaluate

# Electronic lab notebook

**Trainee Notebook**

Unusual network traffic

Increased outgoing network traffic

Decreased outgoing network traffic

Increased incoming network traffic

Decreased incoming network traffic

Large number of connections to a single host

Suspicious log entries

Port scans

Asymmetric network traffic pattern

Suspicious packets

Return to the notebook's main menu

**Trainee Notebook**

Category:  
**Unusual network traffic / Increased incoming network traffic**

Port number:

Comments:

# *Audit*

---

- Monitoring is mechanics
- Assessment is harder
- Audit logs
  - ◆ Provides full records for instructor to evaluate later
  - ◆ Allows trainees recourse if problems with auto-evaluation
  - ◆ Provides data for iteratively refining evaluation techniques

# Audit log

CYDEST CYDEST Manual

## CYDEST User's manual

**Introduction**

- [Requirements](#)
- [Using CYDEST](#)
- [Missions](#)
  - [Mission 1: DoS Attack on a small business](#)
  - [Mission 2: AOC-oriented insider attack](#)
- [Knowledge Base](#)

### Mission 2: Insider attack on a distribution center

Scenario: You are the security officer for a nationwide retailer's trucking distribution center. Your primary concern is the integrity and privacy of the center's database, which stores critical information about deliveries, schedules, and routes. However, many of your driver's routes go through areas in which the mafia is active, which brings the potential for truck hijackings. During the mission, you will receive instant messages (IMs) from your boss with information or instructions, so be alert for new messages. The network is configured as follows:

Target Network

external: 156.23.209.3

internal: 192.168.3.2

firewall: 192.168.3.2

IDS: 192.168.1.10

Router: 192.168.1.11

staff: 192.168.1.10, 192.168.1.11, 192.168.1.12, 192.168.1.13

servers: 192.168.2.100, 192.168.2.101, 192.168.2.102, 192.168.2.103, 192.168.2.104, 192.168.2.105

DataBase: 192.168.2.105

Backup DB: 192.168.2.104

Admin 1: 192.168.2.103

Portal server: 192.168.2.100

Backup portal: 192.168.2.101

Admin 2: 192.168.2.102

Operating Systems: Debian, OpenSolaris, Fedora, Windows Server 2003, Windows XP

Done

fedora

fedora

fedora

For the purposes of this mission, the date is August 29, 2007. Keep this in mind when reviewing log files. The network is primarily used during business hours, which are approximately 8:00 AM to 6:00 PM. Workers are assigned to the hosts in the staff subnet. From there, they access the database servers and portal servers in the servers subnet. They do not have accounts on the hosts in the servers subnet. The user-to-machine assignments are:

User:	horatio	regan	helen	emilia
Host:	plans-ws	ops-ws	strat-ws	isr-ws

**Important:** when finished with your forensics investigation, send an IM to the instructor that includes the text "done." Wait and answer any questions posed. You will receive an IM informing you when you may stop the simulation.

- To access your Fedora and Solaris hosts: username = root and password = cydest
- To access your Debian hosts: username = root and there is no password
- To access your Windows hosts: username = Administrator and password = cydest
- To use OnlineDFS: username = trainee and password = cydest

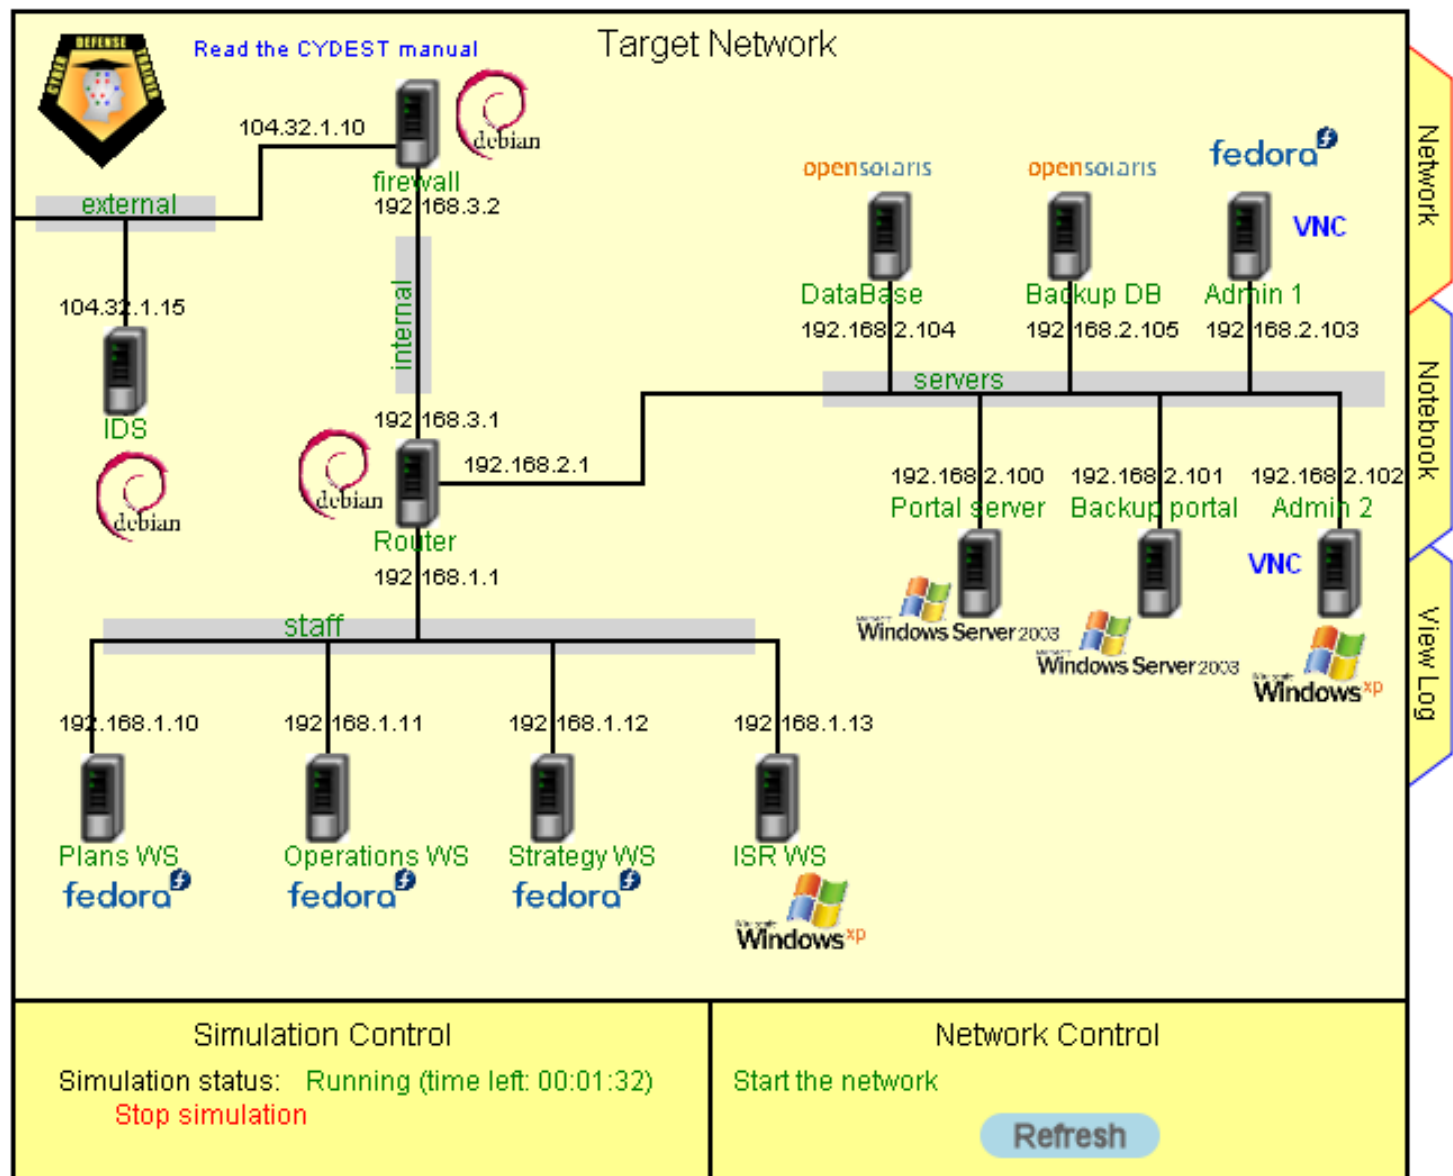

## **Important Concepts:**

[Rootkits](#), [Forensics](#), [Insider attack](#).

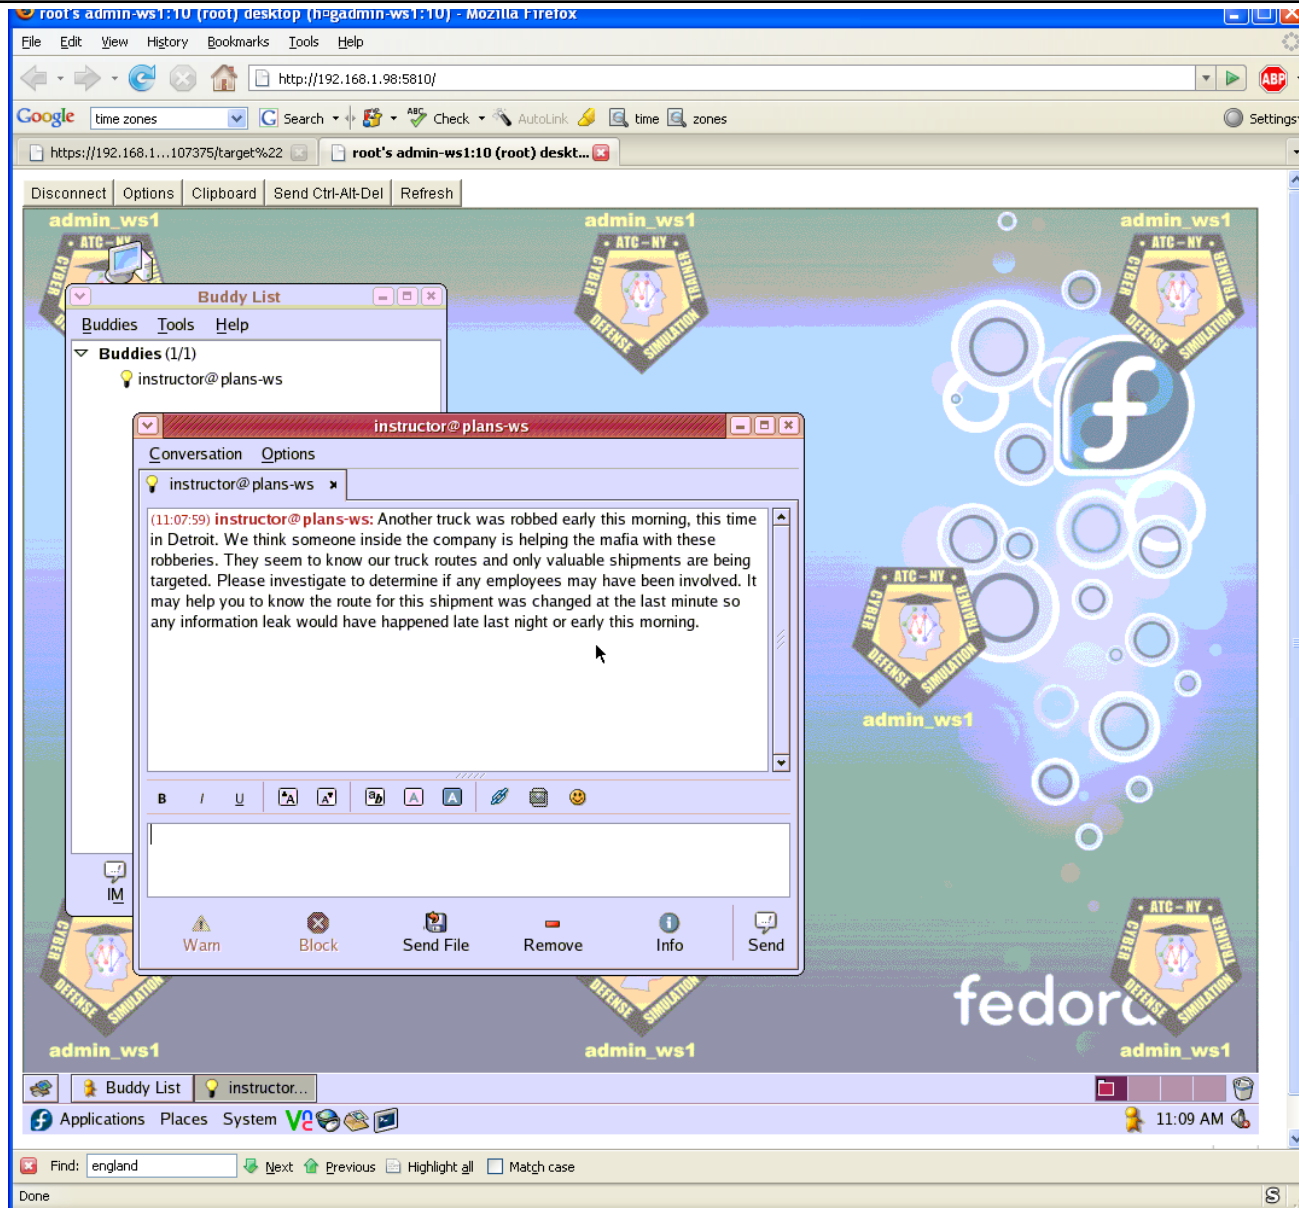

# Network control

# VNC applet

# *Network description*

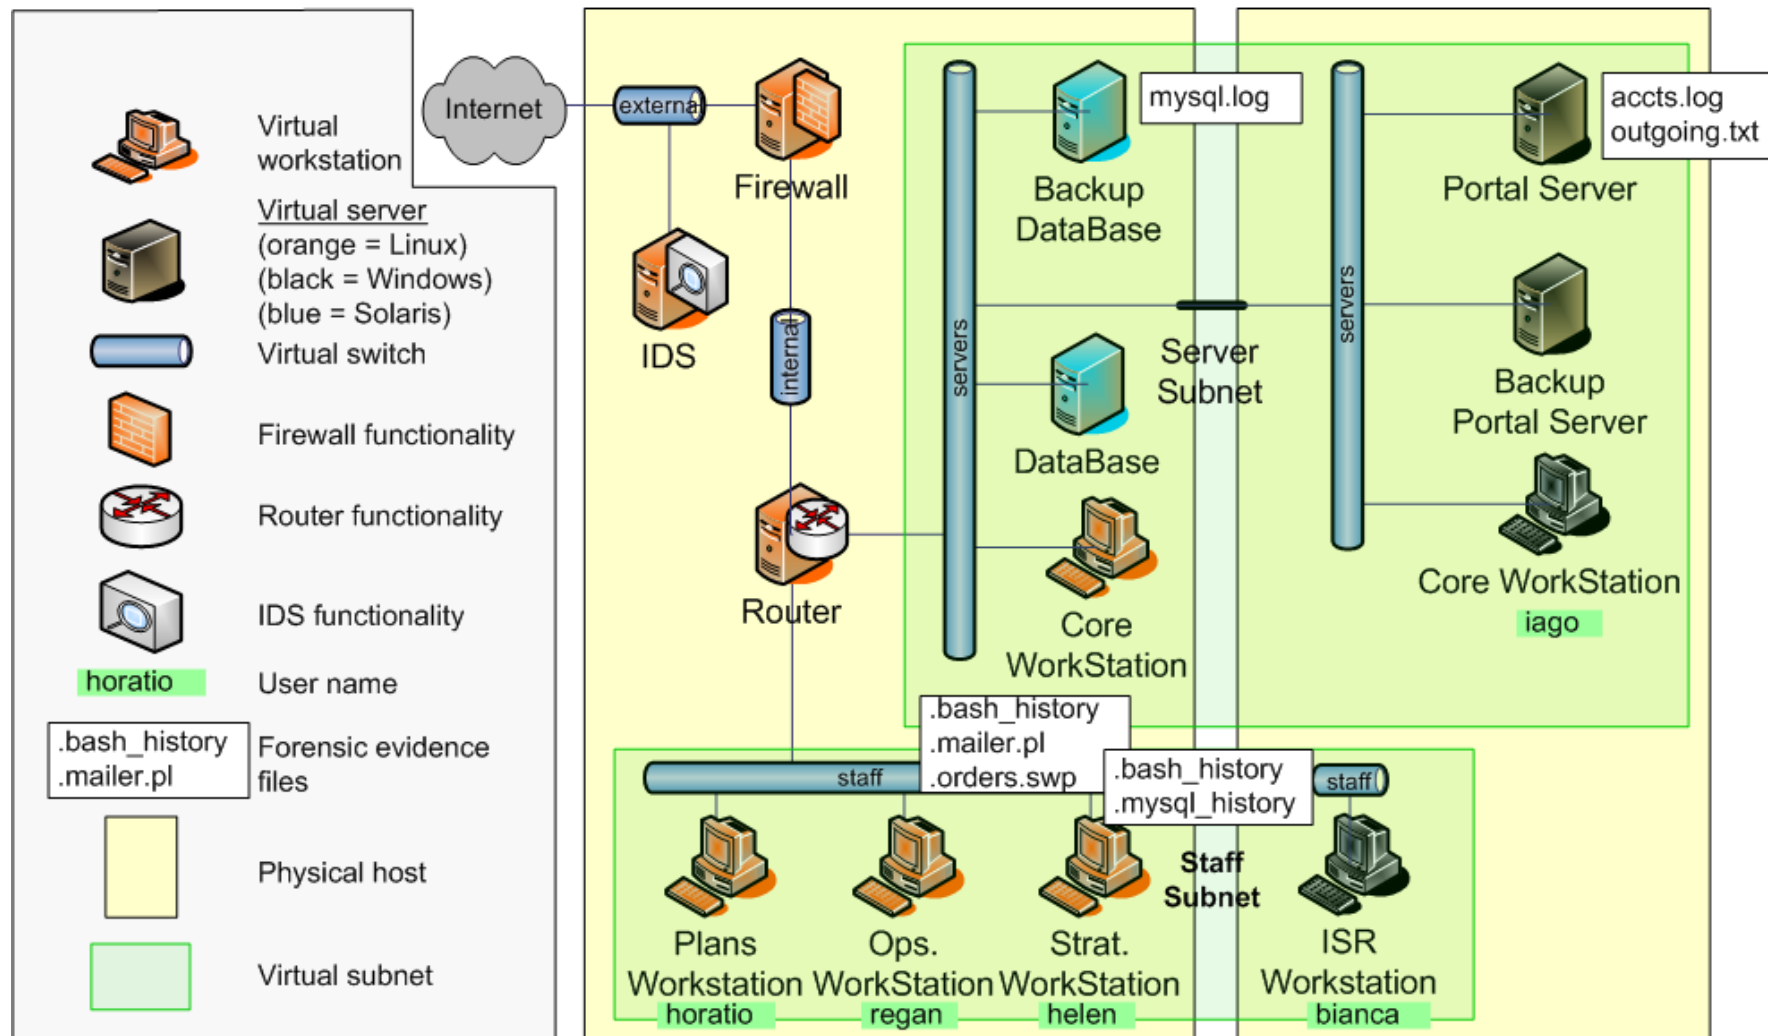

---

- **Shipping department for a nationwide retail chain**
  - ◆ Sensitive shipment and route information stored in corporate database
- **Servers subnet**
  - ◆ 2 Solaris VMs host sensitive information (database & backup)
  - ◆ 2 Windows Server 2003 VMs host portal services (e.g., access control, email, DNS)
  - ◆ 2 trainee launchpad options (Linux Fedora and Windows XP)
- **Staff subnet**
  - ◆ 4 workstations (Linux and Windows) from which workers access the databases and services in the servers subnet
- **Infrastructure**
  - ◆ IDS, Firewall, Router (Debian Linux)

# Trucking department

## AOC-Oriented Scenario: Retailer Trucking Department

Legend

cydest.target1

cydest.target2

# *Attack description*

---

## ■ **Effects-based insider attack**

- ◆ Objective: data exfiltration
- ◆ Attacker: unsophisticated unprivileged user
- ◆ Attacker's motivation: mafia pressure
- ◆ Misdirection: use of other users' accounts
- ◆ Forensic trail:
  - 6 standard log files on 4 VMs
  - 1 "hidden" data file
  - 1 "hidden" illicit program

## ■ **Trainee's mission**

- ◆ follow evidence trail: locate and record evidence files
- ◆ determine attacker
- ◆ exonerate innocent users

## ■ **Tools**

- ◆ Bash command shell
- ◆ Online Digital Forensic Suite™

# *Scenario evaluation*

---

## ■ **Active observation**

- ◆ Monitor bash commands
- ◆ Monitor OnLineDFS logs
- ◆ Points awarded for accessing relevant evidence files
  - More points for primary files
  - Less points for ancillary files
  - Point values decrease as more files are found
  - Point values decrease as time increases
- ◆ Points deducted for thrashing
  - Not following evidence from initial clues
  - Looking at non-relevant workstations
  - Results in hints via IM to look elsewhere

## ■ **Passive observation**

- ◆ All relevant files accessed should be described in notebook
- ◆ Series of questions at end of exercise asks for deductions

# *Field test*

---

## ■ Overview

- ◆ University of New Orleans undergraduate forensics class
- ◆ 18 students in 7 teams of 2-3 students each
- ◆ Teams were given two 2-hour sessions

## ■ Lack of controls

- ◆ Exercise conducted serially by students
- ◆ No classroom time devoted to the exercise scenario

# *Field test results*

---

## ■ **Results**

- ◆ Teams took varying time to complete the exercise
- ◆ Teams found 4-7 of the 8 evidence files
- ◆ All teams determined inside attacker and exonerating other(s)
- ◆ Teams logged only 60% of relevant evidence in Notebook
- ◆ Teams generally did not follow evidence trail from initial clues

## ■ **Feedback**

- ◆ CYDEST framework
  - Network speed
  - OnLineDFS speed and usability
  - Notebook usability
  - IM clarity
- ◆ Scenario
  - Inconsistencies in timestamps
  - Footprints left from set-up

# *Future work*

---

## ■ **Scenario authoring tools**

- ◆ Build virtual networks of VMs (VMscape™)
- ◆ Develop scenario specification language

## ■ **Improved assessment**

- ◆ Currently we evaluate only correctness
- ◆ Reasonableness of an observation?
  - value of information (to augment to what is already known)
- ◆ Reasonableness of a conclusion?
  - conditional probability (given observations and conclusions so far)
