

## Automated Windows Event Log Forensics

*By*

**Rich Murphey**

*Presented At*

The Digital Forensic Research Conference

**DFRWS 2007 USA** Pittsburgh, PA (Aug 13<sup>th</sup> - 15<sup>th</sup>)

DFRWS is dedicated to the sharing of knowledge and ideas about digital forensics research. Ever since it organized the first open workshop devoted to digital forensics in 2001, DFRWS continues to bring academics and practitioners together in an informal environment. As a non-profit, volunteer organization, DFRWS sponsors technical working groups, annual conferences and challenges to help drive the direction of research and development.

# Forensic Process Models

# Forensic Process Models

## Recover:

Step 1 – Extract

- Data Carve for Logs, etc.

Step 2 – Repair and Validate

- Obtain valid log files.

Step 3 – Correlate

- time, files, paths,...

Analyze

Interpret

- Officer/Director calls
  - Something bad happened....
  - Possible contract violation.
  - *Outgoing transfer* of proprietary documents.

## #1: Define a scope of work.

- Can we identify file transfer?
- Examine hard drives
- Email attachments
- File transfer, uploads
- Anything else?

### Good news:

- We know what to look for.
- Well defined keywords, file names

### #2: Preliminary Report

- [D:\OfInterest.doc](#)
- In unallocated space....

### Bad News:

- IT deleted the user profile, and gave laptop to a new employee, six months ago, after they reformatted and reinstalled Windows XP.

## #2: Preliminary Report

- D:\OfInterest.doc
  - In unallocated space....
  - Surrounding data looks like a shortcut.
- Shortcuts contain a *snapshot* of:
  - MAC timestamps
  - Filename
  - Absolute Path, Relative Path
  - Kind of Device (Hard disk/CD-ROM)
  - Partition's Volume Serial Number

- Shortcuts may contain IDs, label, size
  - A snapshot of file's attributes, media's attributes

<b>Link target information</b>	
Local Path	D:\OfInterest.doc
Volume Type	CD-ROM
Volume Label	Nov 11 2006
Volume Serial Number	E2C3-F184
File size	1643743
Creation time (UTC)	11/11/2006 3:21:14 PM
Last write time (UTC)	11/3/2006 10:12:34 AM
Last access time (UTC)	N/A
<b>File attributes</b>	
Read-only	

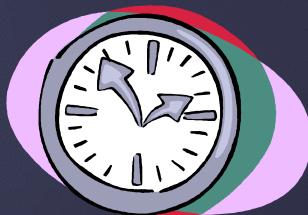

# How to identify outgoing file transfer?

- Data carve for file path, time....

## Where to find time stamps?

- Event logs
- Internet history
- Shortcuts
- Registry, and others?...

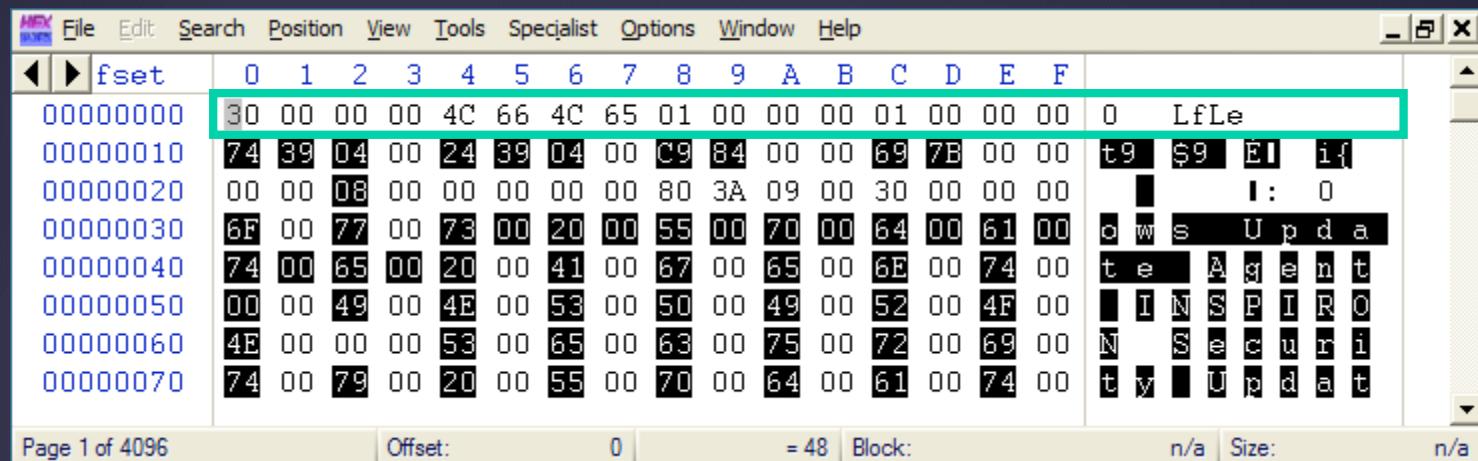

## Log recovery process...

- Step 1 – Extract
  - Data Carve for Logs, etc.
- Step 2 – Repair
  - Fix corrupt log files.
- Step 3 – Correlate
  - Formulate queries for time, names,...

- XP log signature – 16 bytes
  - 30 00 00 00 4c 66 4c 65 01 00 00 00 01 00 00 00

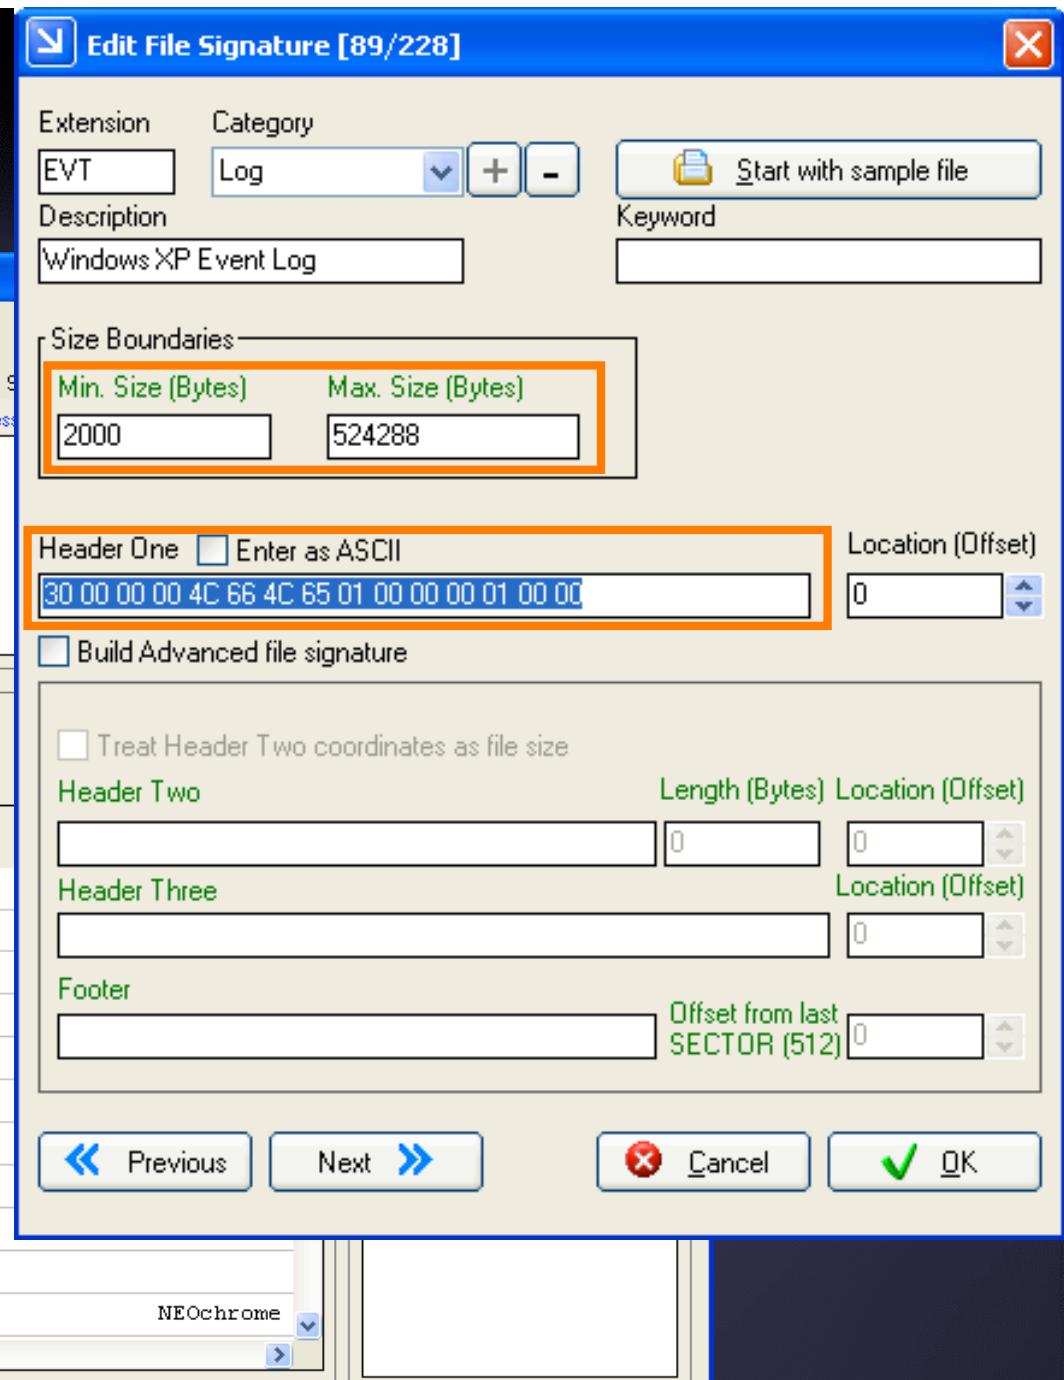

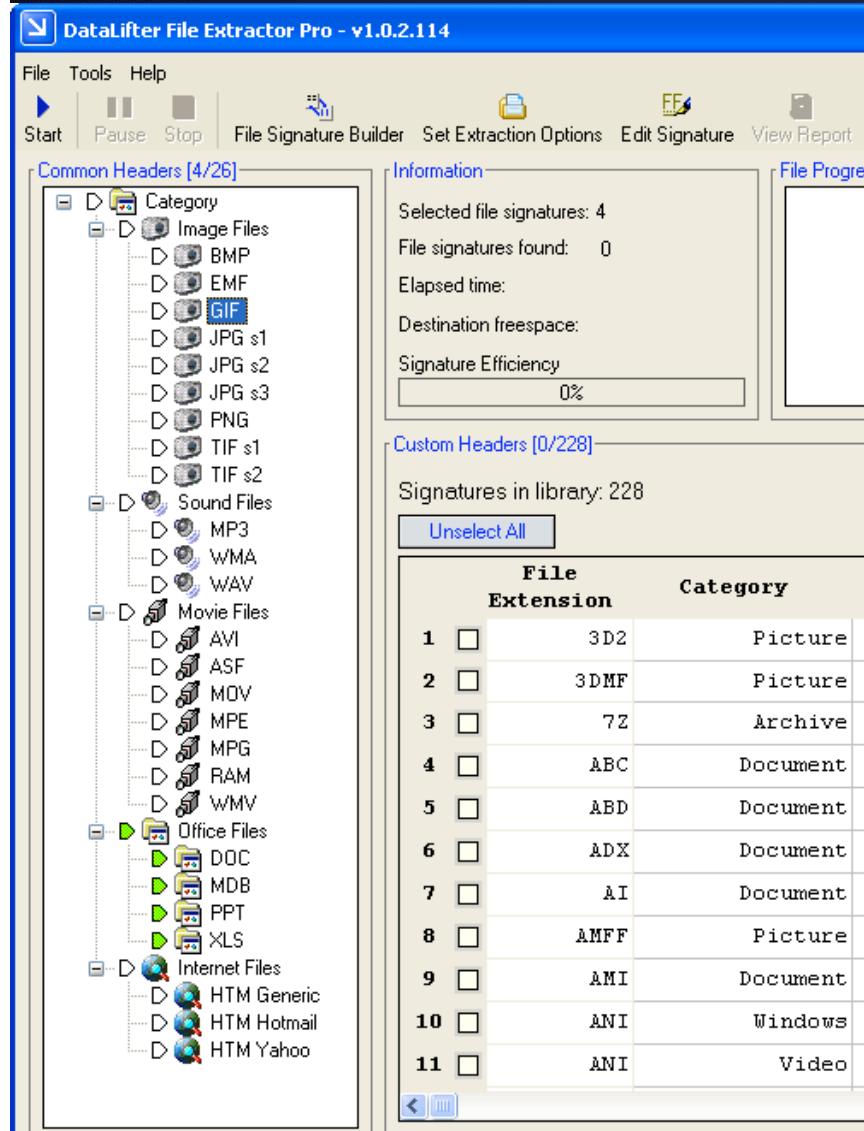

A screenshot of a hex editor window titled "File Edit Search Position View Tools Specialist Options Window Help". The window displays a table of memory contents. The columns are labeled fset, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F, and a column for ASCII characters. The first row shows the byte sequence: 30 00 00 00 4C 66 4C 65 01 00 00 00 01 00 00 00, followed by the ASCII characters "LfLe". The second row starts with the value 74. The third row starts with 00. The fourth row starts with 6F. The fifth row starts with 74. The sixth row starts with 00. The seventh row starts with 4E. The eighth row starts with 74. The bottom status bar shows "Page 1 of 4096", "Offset: 0", "= 48", "Block: n/a", "Size: n/a", and "n/a".

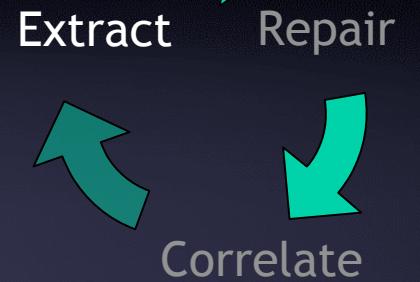

fset	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F

- Typical log sizes:
  - 512K on desktops
  - 1MB on servers

# •Using DataLifter:

## Log Recovery

scalpel.conf entry:

- evt y 1048576  
  \x30\x00\x00\x00\x4c\x66\x4c\x65  
  \x01\x00\x00\x00\x01\x00\x00\x00

- Step 1 – Initial script to recover logs:  
  scalpel /dev/sda1

## Step 1 – Extract

# The Results:

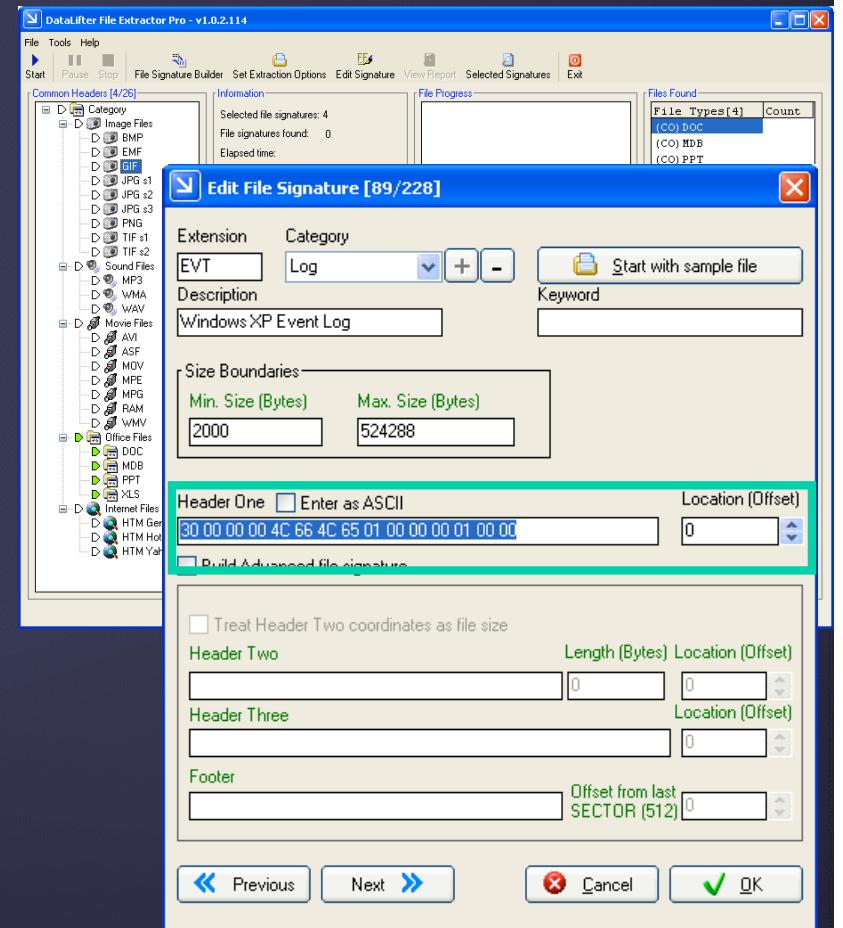

- Step 1 – Extract
  - Run DataLifter
  - 100 logs are extracted.
  - Only two are viewable.
  - 98 corrupt logs
- Step 2
  - Repair 98 corrupt logs?

evt y 1048576

\x30\x00\x00\x00\x4c\x66\x4c\x65

\x01\x00\x00\x00\x01\x00\x00\x00

%scalpel /dev/sda1

  - Time, SID, Source, Severity, Message

windows/system32/config:

- AppEvent.evt
- SecEvent.evt
- SysEvent.evt
- Internet.evt

- FixEvt – an XP log repair tool

- Automatically repairs corrupt logs

- Repairs or identifies known forms of corruption.

- In seconds.

<http://murphey.org>

#### **FixEvt - Repairs Corrupted Windows Event Logs**

FixEvt is a native Windows console (command line) application that repairs a common form of corruption of Windows event logs that occurs when the event logging service stops without properly closing the log file.

##### **Download Now:**

- [fixevt.exe](#) (Executable for Widows 98, NT, 2K, XP, 2003, and Vista)
- [fixevt.exe.md5.txt](#) (md5 checksum of the above executable)

Fixevt.exe is a native, standalone, console (command line) application for Windows 98, NT, 2K, XP, 2003, and Vista. It requires no other files, and no installation. Simply download the executable and run it from the command line as shown below. To see this documentation, invoke it with no command line arguments.

Stephen Bunting first described the signs of log corruption and a manual method to repair it on his web site.

<http://linuxbox.cms.udel.edu/forensics/repaireventlogfile.htm>

## Steve Bunting's Manual Method

000000020	00	00	08	00	00	00	00	00	80	3A	09	00	30	00	00	00	I: 0	

- Available on the web.
- A 4K command line executable.
- Very simple – no install.

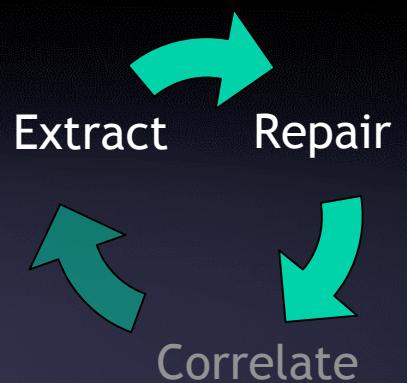

```
% fixevt *.evt
```

- For each log, FixEvt reports either:
  - 1 - Did not need repair
  - 2 - Was repaired
  - 3 - Cannot be repaired
  - 4 - Might be repaired by another method

# How the process works

- Step 1 – Extract
  - Run DataLifter
  - 100 logs are extracted.
  - 98 corrupt logs.
- Step 2 – Repair the Logs
  - Manual: 15 minutes/log \* 98 Logs = 3 days
  - “FixEvt \*.evt”: 2 seconds.

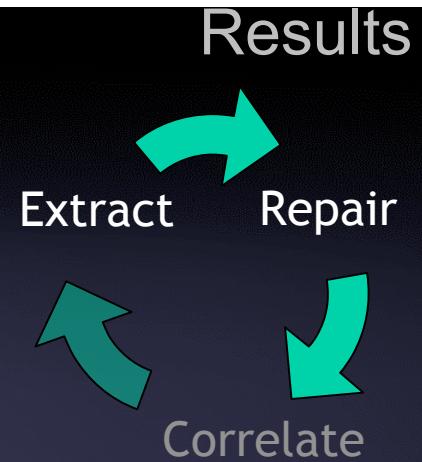

# The Results:

- Step 1 – Extract
  - 100 logs are extracted.
  - 98 corrupt logs.
  - 2 valid logs
- Step 2 – Repair
  - 50 logs repaired
  - 52 Total logs.

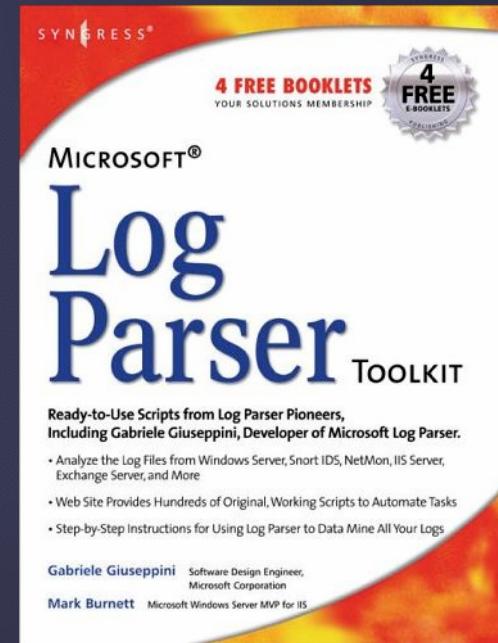

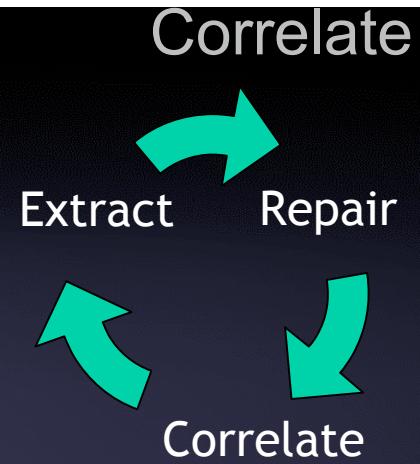

```
scalpel /dev/sda1  
fixevt *.evt
```

- Step 3 – Correlate events in 51 logs?

# LogParser

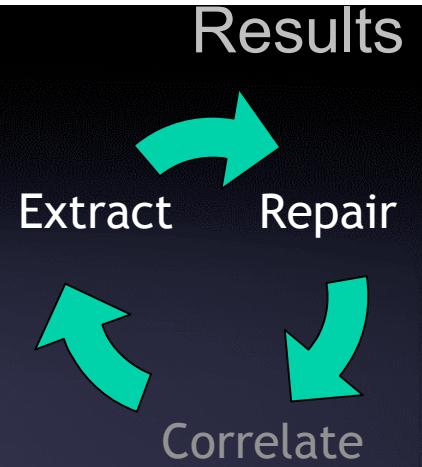

- Input:
  - evt, IIS, REG, FS, ADS
- Output:
  - csv, XML, SQL, HTML
- Run SQL queries on multiple log files

- 50 logs were repaired.
  - Some are still invalid due to corruption.
  - Tools will not parse a sets containing corrupt logs.
- Use LogParser to validate the logs.
  - LogParser "select count(\*) from log.evt"
  - Returns an error status that indicates parsing errors.
- Script to extract, repair and validate logs:

```
scalpel /dev/sda1
fixevt *.evt
for i in *.evt;do LogParser "select count(*) from $i" \
&& cp $i goodlogs; done
```

- Result: 46 total valid logs
  - 23 empty, 23 non-empty
  - 87,413 events total
- 14 months of activity  
*prior to reformatting* of the hard drive.

## Step 3 – Correlate

select <columns> from <table> into <output-file>

logparser “select \* from system.evt into excel.csv”

- Reads the log file: system.evt
- Creates a spreadsheet of comma separated values
- “\*” selects all columns of data

## Write Queries – for correlating time, name...

... select TimeGenerated, Message from system.evt ...

- Output timestamp and full message

... where TimeGenerated > '2006-11-11 00:00:00'  
and TimeGenerated < '2006-11-12 00:00:00'

- Filter a one day period.

... where Message like "%CD Burning%" ...

- Filters for start, stop, running events

# SQL queries to identify patterns

logparser

```
“select TimeGenerated, Message  
from system.evt  
where TimeGenerated > ‘2006-11-11 00:00:00’  
and TimeGenerated < ‘2006-11-12 00:00:00’  
and Message like “%CD Burning%”
```
